

# Technical Assessment

For this assessment you will use Unity to create a Match Three Bonus using only the assets provided. We want to see your creativity and technical ability within a set of requirements. Please do not use any third-party code or assets. This assessment must be completed within seven days of receipt. Please return the required items specified below. If you are not able to fully complete the assessment within the timeframe, please return what you have finished and a description of what parts you were not able to complete.

## Match Three Bonus

A Match Three Bonus game is very common in slot gaming. The player is presented with multiple tokens to select. When the player selects a token, it flips over and reveals a prize. Once three matching prizes are revealed, that prize is awarded, and the bonus is complete.

## Application Description

When the application begins a menu page should be displayed, consisting of four buttons that allow the player to select which prize will ultimately be awarded in the bonus round. The buttons should be labeled Mini, Minor, Maxi, and Major, representing the available jackpot or progressive awards where Mini is the lowest value (ex. \$50) and Major is the highest (ex. \$20,000). Once a prize is selected from the menu, a shuffled prize sequence should be created that consists of twelve elements (three of each prize) with the first instance of three matching prizes being the player selected prize.

A few examples of possible shuffled prize sequences on either end of the spectrum:

1. The player selects Mini from the menu page and the prize sequence is created with Minis as the first three elements in the sequence, followed by the remaining nine prizes.
  - Mini, Mini, **Mini**, Major, Maxi, Maxi, Minor, Maxi, Major, Minor, Minor, Major
2. The player selects Mini from the menu page. The prize sequence is created with two of each prize as the first eight elements, the ninth element being the third Mini, followed by the remaining three prizes.
  - Major, Maxi, Minor, Maxi, Mini, Major, Mini, Minor, **Mini**, Major, Minor, Maxi

The Match Three Bonus scene should be loaded and passed the prize sequence. When the bonus round starts it should display 12 animating tokens that can be selected. When a token is selected, the token flips and reveals the next prize from the sequence. That token should no longer be selectable. Once three matching tokens are selected, the prize is awarded, and the bonus round is complete.

The three winning tokens should be highlighted, and the unselected tokens should reveal the remaining prizes in the sequence in an apparent inactive state. Once the award sequence is complete the application should return to the menu page, unload the bonus scene, and allow the player to select another prize and start another bonus round.

If the player has not selected a token after 20 seconds from the end of the last token reveal or from entering the bonus round, a random token should be selected automatically from the remaining unselected tokens. After 10 seconds of not selecting a token, a countdown timer should be displayed letting the player know how much time they have before a token is automatically revealed.

## Requirements

- Must have exactly two scenes: the menu page and the bonus round.
- No matter which token is selected, the next prize from the prize sequence must be revealed.
- The bonus round must always contain exactly 12 tokens (4 prizes with 3 tokens each).
- There must be no visual indicator as to how many tokens will be selected before the player matches three prizes and completes the bonus round.
- When one token has been selected and the token's prize is being revealed, the player must not be able to select any other token until the reveal is complete.
- After pressing the button from the menu scene to select which prize will be awarded, the game should be able to show the entire bonus round without needing further input from the player (see the auto pick information from the description).
- Please use one of the following Unity versions: 2019.4.32F1, 2021.3.22F1, 2022.3.14F1.

## What to Return

Please return a zip file containing the following items:

1. A copy of your Unity project, including all code and assets used.
2. A text file specifying which version of Unity you used, along with any additional details you think we will need to review your assessment.
